(54) Pharmaceutical formulations in form of thixotropic gel

(57) The present invention relates to a topical formulation of gel-like consistency, but nebulizable by a mechanical pump, containing colloidal silices as gelifying agent.

EP 0 733 357 A1

Description

The present invention relates to a topical formulation of gel-like consistency, but nebulizable by mechanical pump, containing colloidal silices as gelifying agent.

PRIOR ART

The preparation of a semi-solid system nebulizable by means of a spray mechanical system seemed up to now to be an unsurmountable problem. In fact, efforts to prepare formulations making use of the conventional, most used gelifying agents lead to the production of gels which, although being highly valid, are absolutely not sprayable. Even making a compromise, namely decreasing the system viscosity, at the most the emission of the product from the mechanical pump is obtained, but not the nebulization. Moreover, decreasing viscosity, the product tends to leak once sprayed on the concerned part.

In the cosmetic field, the so-called gel-sprays exist, which however have an exceedingly low viscosity, thereby tending to leak after the emission, therefore they cannot be even defined gels. Moreover they are usually prepared using acrylates such as Carbopols.

DISCLOSURE OF THE INVENTION

The present invention overcomes the problems of the prior art, by the use of a high viscosity system, ~~which is~~ nearly semisolid, characterized in that it is destructurated by a mechanical stress

The pharmaceutical formulations in form of thixotropic gel of the present invention will contain, besides an active ingredient, a colloidal silica in an amount from 2 to 15% by weight, propylene glycol in an amount from 1 to 10% by weight. Water and any excipients conventionally used in the pharmaceutical techniques, such as surfactants, preservatives, flavouring agents, co-solvents and lipophilic phases can also be present. Particularly preferred surfactants are those belonging to the following classes:

- Sorbitan esters (for example Span 20, Span 40, Span 60, Span 65, Span 80, Span 85);
- Polyoxyethylene sorbitan esters (for example Tween 80, Tween 60, Tween 40, Tween 20);
- Polyoxyethylalkyl ethers (for example Cremophor A, Bryj, Texofor A);
- Polyoxyethylene stearates (for example Myrj 52, Myrj 53).

The pharmaceutical formulations of the invention will preferably contain a colloidal silica having a surface area of 175-225 m^2/g and an average diameter of 12 nm, in amounts ranging from 2 to 8%, more preferably from 2.5 to 7% by weight.

In the pharmaceutical formulations of the invention, water may be present in an amount ranging from 60 to 97% by weight.

The present invention provides a system characterized by:

- Pseudoplasticity: the viscosity decreases with the increase in the intensity of the applied stress;
- Thixotropy: the viscosity decreases with time, as the applied stress goes on.

The system of the present invention uses as gelifying agent colloidal silices, which are excipients widely used in the topical field as thickening and suspending agents, and in the oral solid as lubricants.

It should be noted that within the definition "colloidal silica" lie several commercial products used as pharmaceutical excipients, whose characteristics can be summarized as follows:

Surface area from 50 to 400 m^2/g
Average diameter from 7 to 40 nm.

All of these materials give similar gelification phenomena but, since gelification occurs through adsorption, the surface area characteristics become paramount for the choice of the type and amount of colloidal silica to use.

Suitable silices according to the invention have a surface area ranging from 130 to 300 m^2/g and an average diameter of 12 nm.

The present invention uses specifically as colloidal silices Aerosils, preferably colloidal silices with characteristics similar to Aerosil 200.

Aerosil characteristics of pseudoplasticity and thixotropy are well known, however up to now said characteristics have not been made use of in order to spray/nebulize a product in the form of gel by the simple pressure of a finger.

In essentially aqueous systems, aerosils (only) at high concentrations (5-15%) cause the structuration of water through adsorption phenomena, until a consistence of gel (or, more correctly, magma). The Aerosil-Water bond is very mild and it can be cleaved by even slight stresses, such as those caused by a mechanical pump. During the stress, and therefore during the spray, the viscosity of the system remarkably decreases, thereby allowing the nebulization. Once applied to the skin, the sprayed product, no longer stressed, quickly returns to its original state, acquiring back a gel-like consistence.

It is particularly surprising that, when in the formulation of the invention besides Aerosil and water, a less polar solvent is also present, such as glycerol, polyoxyethylene glycol, diethylene glycol monoalkyl ether (Transcutol™), N-methylpyrrolidone, glycofurol, isopropanol, ethylene glycol, propylene glycol, viscosity falls upon the slightest mechanical stress; in the absence of said solvent, such a phenomenon appears less markedly, but anyhow so as not to affect adversely the thixotropic characteristics according to the invention. The use of the propylene glycol is particularly preferred.

The topical gel formulation of the present invention can be administered with a suitable dosage, through doser mechanical pumps which dispense prefixed volumes.

The topical formulations of the present invention can be used, besides for the topical administration on the skin, also for the vaginal, nasal, otological administration, wherein the absence of leakage and the in loco persistence are particularly important.

The gels of the present invention will preferably be dispensed by means of mechanical pump dispensers.

The formulations of the invention can also contain all of the active ingredients whose topical administration is therapeutically effective. Examples of active ingredients which can be used in the formulations of the invention comprise: non-steroidal antiinflammatory agents, such as ketoprofen, ibuprofen (including optical isomers and salts thereof), naproxen, diclofenac, diflunisal, nimesulide, ketorolac, flurbiprofen, indomethacin, acetylsalicylic acid and the like; antifungal drugs such as miconazole, econazole, fluconazole, tyrothricin, antibacterials/antibiotics such as polymyxin, neomycin, kanamycin, gentamycin, tetracycline, meclocycline, clindamycin; antiviral drugs such as acyclovir, cytarabine; corticosteroids; antihistamines; sympathomimetic drugs; antiallergic drugs such as disodium cromoglycate; local anesthetics; cicatrizants; capillary-protective substances; bioflavonoids; retinoids; vitamins; enzymes; growth factors.

Some examples of pharmaceutical and para-pharmaceutical formulations containing active ingredients at therapeutical concentrations are reported hereinbelow. a.i. = active ingredient

Claims

1. Pharmaceutical compositions in form of thyxotropic gel containing an active ingredient, from 2 to 15% of a colloidal silica, water and optionally excipients.

2. Pharmaceutical compositions according to claim 1 further comprising a solvent selected from glycerol, polyoxyethylene glycol, diethylene glycol monoalkyl ether (Transcutol™), N-methylpyrrolidone, glycofurol, isopropanol, ethylene glycol, propylene glycol in an amount from 1 to 10% by weight.

3. Pharmaceutical compositions according to claim 2, wherein the solvent is propylene glycol.

4. Pharmaceutical compositions according to any one of the previous claims, wherein the colloidal silica has a surface area ranging from 130 to 300 m^2/g and an average diameter of 12 nm.

5. Pharmaceutical compositions according to any one of the previous claims, wherein the colloidal silica has a surface area ranging from 200-25 m^2/g and an average diameter of 12 nm.

6. Formulations according to any one of the previous claims wherein the excipients are selected from surfactants, preservatives, flavouring agents, co-solvents and lipophilic phases.

7. Formulations according to any one of the previous claims, wherein water is present in an amount ranging from 60 to 97% by weight.

8. Formulations according to any one of the previous claims, further comprising a surfactant selected from sorbitan esters, polyoxyethylene sorbitan esters, polyoxyalkyl ethers, polyoxyethylene stearates.

9. Formulations according to any one of the previous claims, containing from 2 to 7% by weight of colloidal silica.

10. Spray pharmaceutical compositions containing the gels of claims 1-9 in containers with mechanical pump.
